

- Bill Pine
- billpine@ufl.edu

- Massive team effort

- Objective: 2009 Peter Frederick and I were interested in helping people by trying to understand observed declines in Suwannee Sound, FL oyster populations

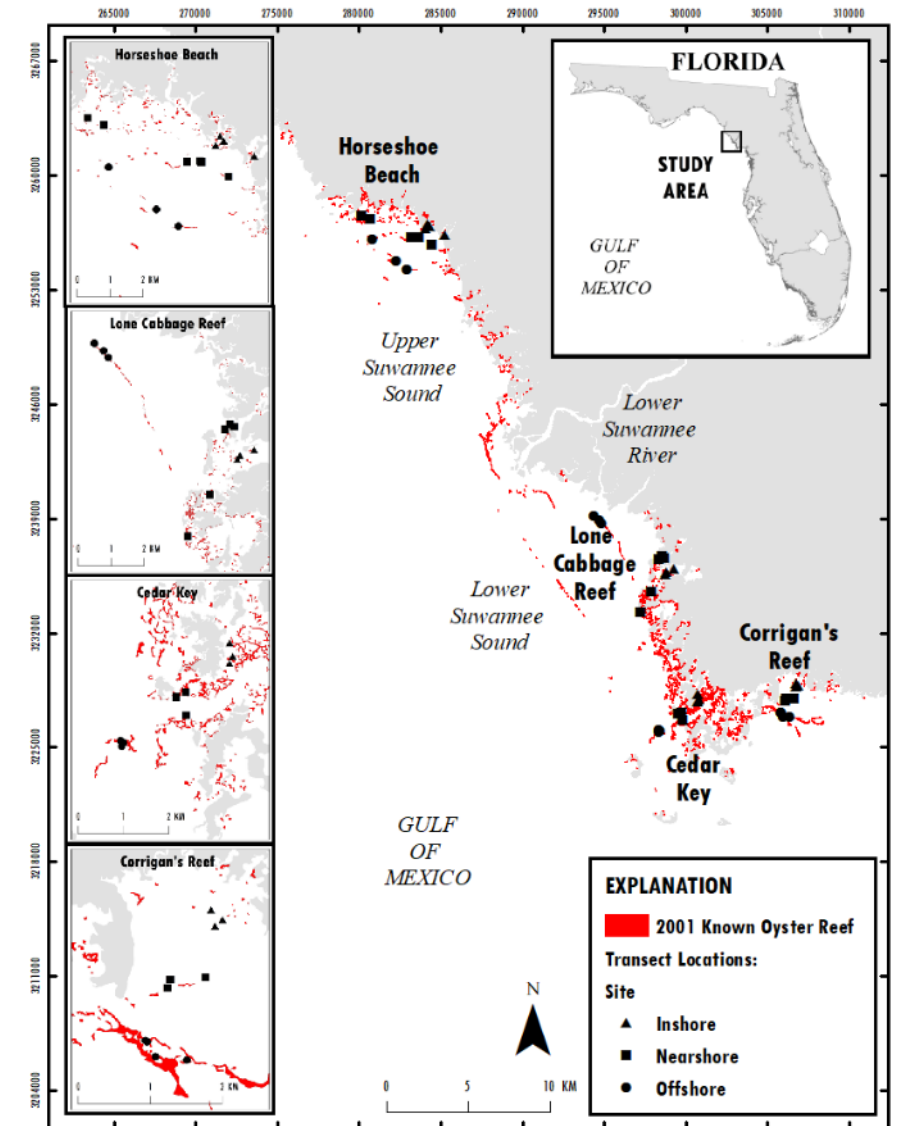

Initial assessments...

Large spatial scale

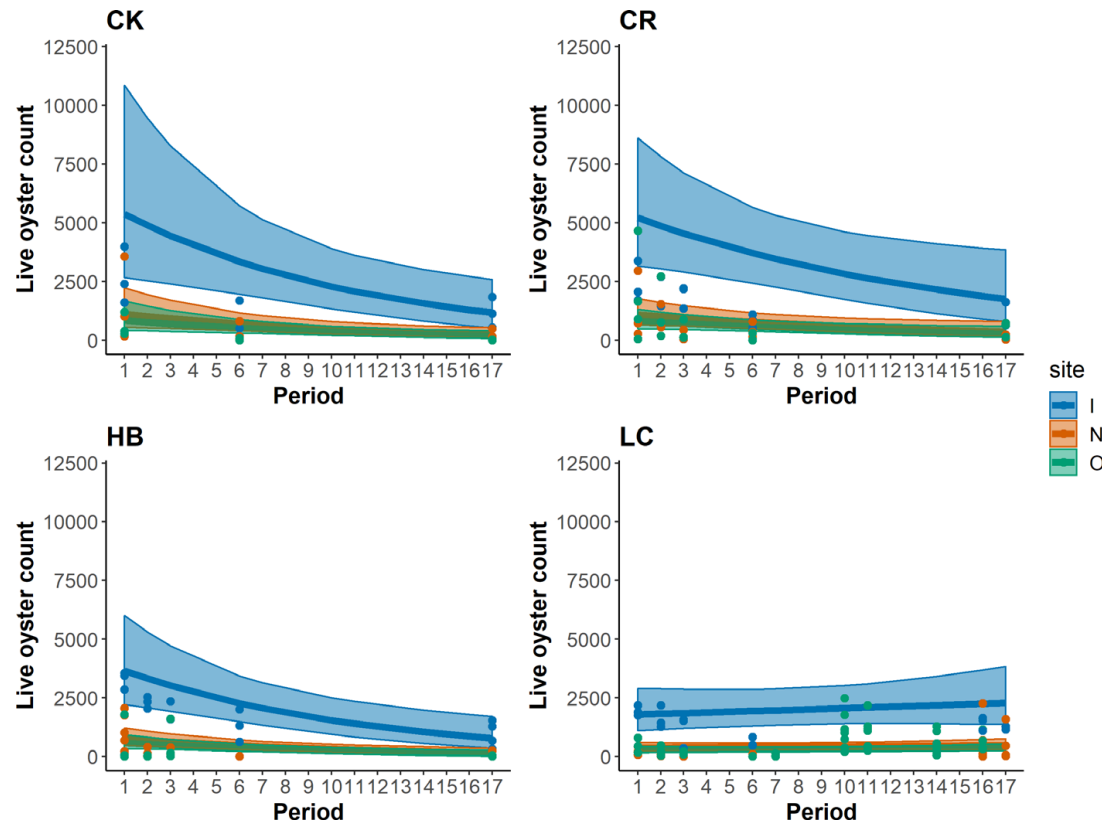

Small spatial scale

Multiple spatial scales...

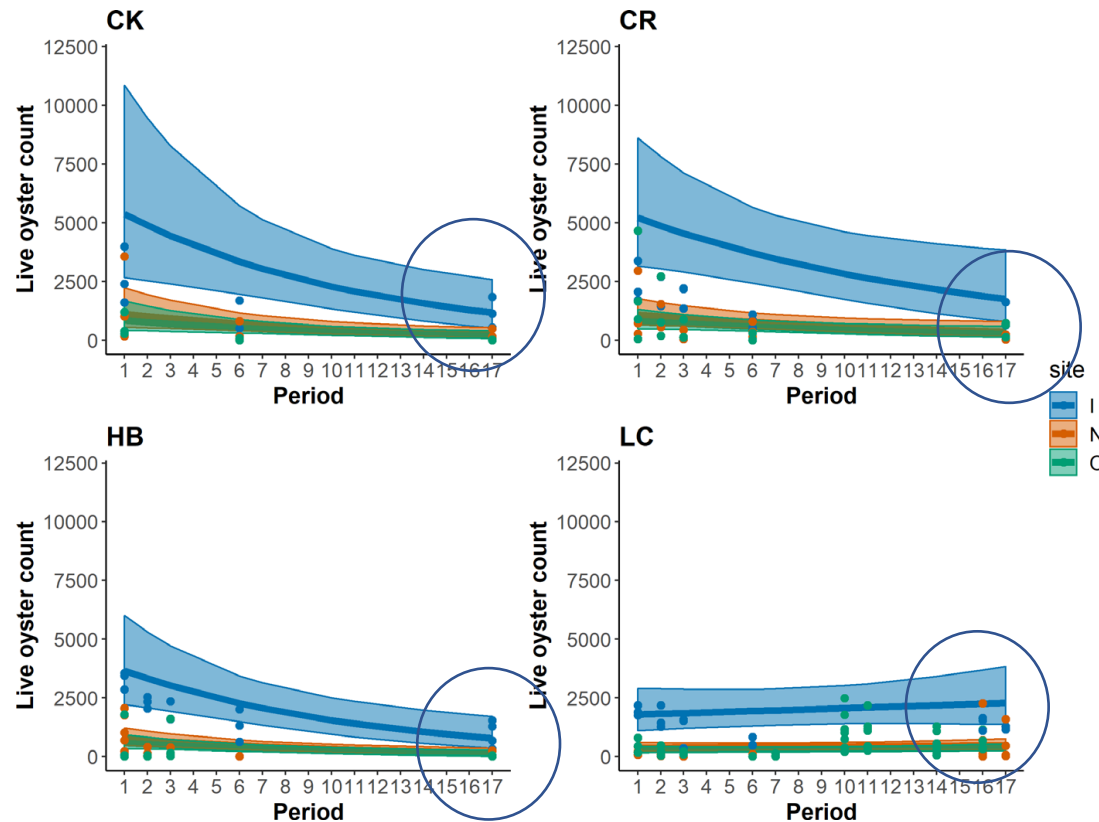

What are we learning?

- Intertidal oyster resources are declining rapidly across the Big Bend
- 237% decline in counts of intertidal oysters since 2010
- Intertidal reefs are becoming more similar...

What are we learning?

- Intertidal oyster resources are declining rapidly across the Big Bend
- 237% decline in counts of intertidal oysters since 2010
- Intertidal reefs are becoming more similar...
 - But more similar AT LOWER NUMBERS OF OYSTERS

How can restoration be used to test hypotheses?

How can restoration be used to test hypotheses?

- Reef decline a one-way trip
- Once reefs collapsed and shell material lost re-colonization not possible

How can restoration be used to test hypotheses?

- Reef decline a one-way trip
- Once reefs collapsed and shell material lost re-colonization not possible
- H_0 = Addition of durable substrate will allow oyster reef re-colonization and persistence

How can restoration be used to test hypotheses?

- Reef decline a one-way trip
- Once reefs collapsed and shell material lost re-colonization not possible
- H_0 = Addition of durable substrate will allow oyster reef re-colonization and persistence
- Developed an experiment and monitoring program to test hypothesis → *part of an adaptive management program*

2013 Pilot Restoration Project

Journal of Shellfish Research, Vol. 35, No. 2, 359–367, 2016.

**REVERSING A RAPID DECLINE IN OYSTER REEFS: EFFECTS OF DURABLE SUBSTRATE
ON OYSTER POPULATIONS, ELEVATIONS, AND AQUATIC BIRD
COMMUNITY COMPOSITION**

18 months

9x increase in oyster density on restored sites compared to control

2018 Restore Lone Cabbage

- NFWF-GEBCO funded restoration of Lone Cabbage Reef
- Local sourced limestone placed on degraded chain of reefs
- 5-km in length x 10-m wide

- High-resolution, statistically robust monitoring program
 - ~3000-m of line transect
 - During winter
 - Allocated to restored/control & open/closed to fishing strata
 - Effort dynamically updated within season based on observed results

July 2018

December 2018

July 2019

Can restoration help?

- Local effect of oysters growing on rocks? YES!
- But do these oysters persist?

Can restoration help?

- Local effect of oysters growing on rocks? YES!
- But do these oysters persist?
- Just finished fourth winter of monitoring

**Double data entry with built in error
checking routine**

**Data are entered and summarized
within 3 days of field sampling...**

**... to Github as repository for all data
and standard code**

... to weekly reports in RMarkdown

**What can we learn from the
weekly reports?**

Progress

Problems

Planning

Sampling Protocols – Power Analyses

Before season starts, run power analyses based on previous years of data (period 18-22) and just last year (period 22)

Mid-season re-run power analyses using new data from period 24

R script – takes about 1 day to run

Decision making

How does period 24 compare to previous?

Live Oyster Counts by Period

Period	Mean	Median	SD	Var	CV	SE	L95	U95	Bstrap_Mean	L95_Bstrap	U95_Bstrap
18	982	695	935	874733	0.95	120	748	1217	982	751	1202
20	1844	1253	2125	4517189	1.15	310	1236	2451	1848	1321	2500
22	1334	702	1693	2867783	1.27	242	860	1808	1340	907	1870
24	1463	1102	1301	1693414	0.89	277	919	2007	1453	976	2050

Live Density by Period

Period	Mean	Median	SD	Var	CV	SE	L95	U95	Bstrap_Mean	L95_Bstrap	U95_Bstrap
18	176	155	130	16945	0.74	17	144	209	177	145	209
20	256	203	187	35057	0.73	27	203	310	257	209	308
22	137	121	93	8638	0.68	13	111	163	137	112	162
24	187	178	94	8801	0.50	20	148	226	186	149	225

Similar process with water quality

1 Water Quality Quarterly Figures

Can restoration help?

- Oysters persist on restored reefs (so far)
- Similar median density of oysters on rock reefs compared to wild reefs

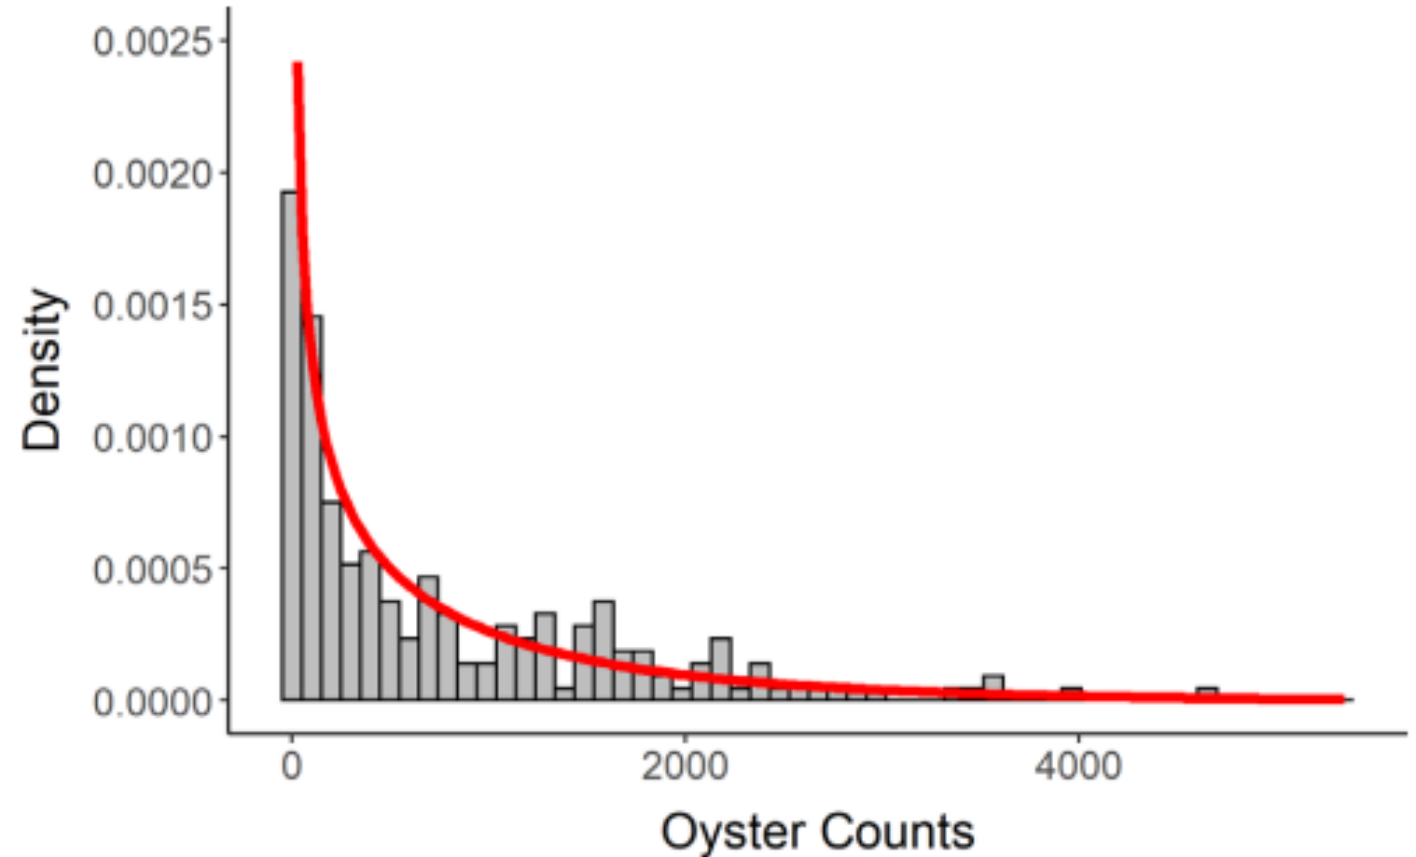

Two lines of inference on oyster population trends and response to restoration

- (1) Repeated measures fixed locations
- (2) Random sampling restored and unrestored

Very high overdispersion

GLM $\text{count_live} \sim \text{period} + \text{offset}(\log(\text{tran_length}))$

Can incorporate covariates
salinity, open/closed harvest,
elevation, etc.

(1) Repeated measures fixed locations

***Strong positive response to restoration, then $\rightarrow k$?**

(2) Unrestored and restored sites

***Positive response on restored**

***Unrestored continue to decline**

***Unrestored and restored similar counts**

Example inference from fixed-location repeated measures sites

(1) Repeated measures fixed locations

***Strong positive response to restoration, then $\rightarrow k$?**

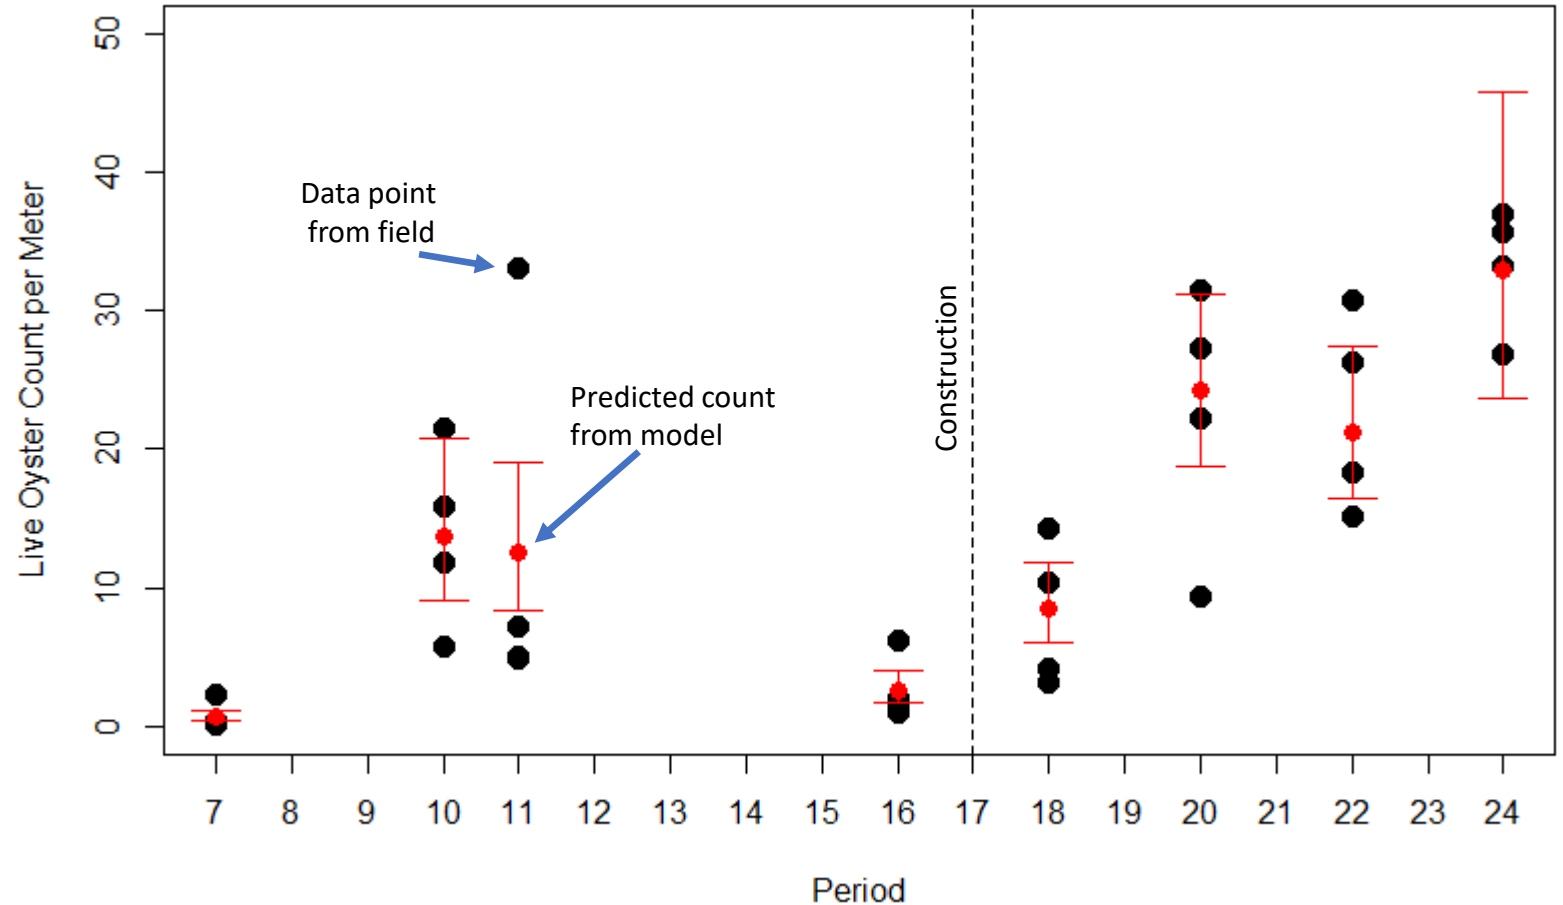

(2) Unrestored and restored sites

***Positive response on restored**

***Unrestored continue to decline**

***Unrestored and restored similar counts**

Example inference from fixed-location repeated measures sites

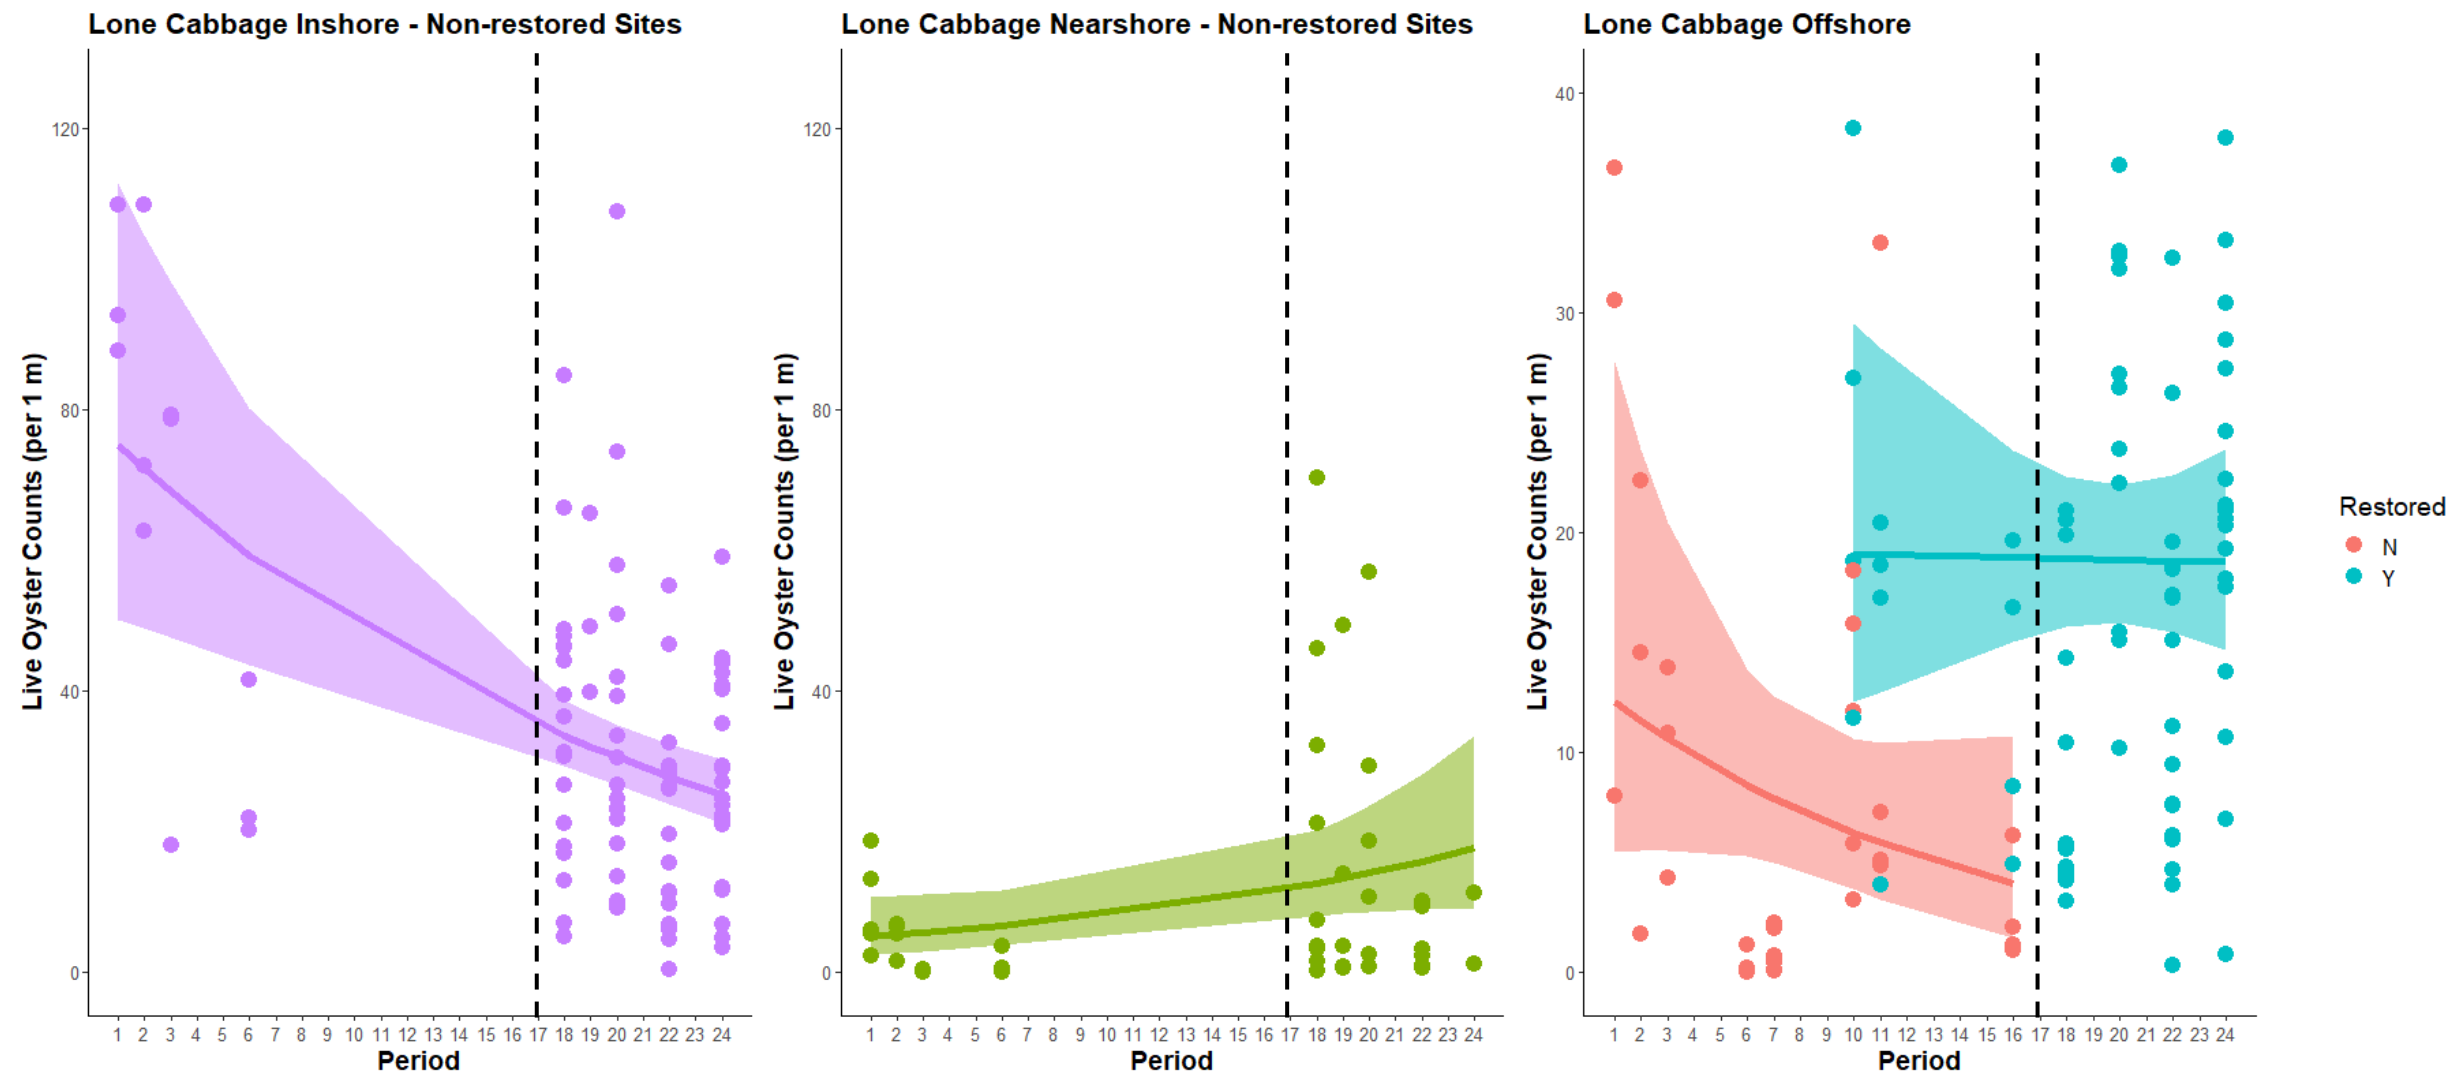

Can restoration help?

- **Benefits beyond the ribbon of rock?**

Key result from winter 2021/2022

Not likely to be spurious – supported by resampling

< BIODIVERSITY AND CONSERVATION

Bootstrap methods can help evaluate monitoring program performance to inform restoration as part of an adaptive management program

- Repeat restoration 5000 times

Histogram of rocks

Not likely to be spurious – supported by resampling

< BIODIVERSITY AND CONSERVATION

Bootstrap methods can help evaluate monitoring program performance to inform restoration as part of an adaptive management program

- Repeat restoration 5000 times
- Same result → positive response for restoration 100% of the time
- Type of power analyses

Can restoration help?

- Overall continued declines in unrestored oyster reefs
- Very wide range in counts of oysters across unrestored reefs
- Restored reefs similar counts and size structure of unrestored
 - <2% of 23,000+ oysters measured intertidal bars since 2010 legal size

Going forward

- **Treat restoration projects as experiments not solutions**

Going forward

- **Treat restoration projects as experiments not solutions**
- **Focus research efforts on promoting resilience in existing wild reefs**
 - **Why are wild reefs declining?**

Is Lone Cabbage a
“success”?

Is Lone Cabbage a “success”?

- We have demonstrated an AM process that has resulted in significant learning about restoring oyster resources in Suwannee Sound
- We feel strongly that the project offers a framework to advance learning beyond the project scale

Is Lone Cabbage a “success”?

- Lone Cabbage project monitoring phase < 2 years remaining
- Learn faster & improve outcomes by not always starting at zero
 - Existing modern data workflow and analyses framework
 - Rigorous oyster and water quality monitoring framework
 - More time learning, less time launching

Trends in Oyster Populations in the Northeastern Gulf of Mexico: An Assessment of River Discharge and Fishing Effects over Time and Space

< BIODIVERSITY AND CONSERVATION

Bootstrap methods can help evaluate monitoring program performance to inform restoration as part of an adaptive management program

REVERSING A RAPID DECLINE IN OYSTER REEFS: EFFECTS OF DURABLE SUBSTRATE ON OYSTER POPULATIONS, ELEVATIONS, AND AQUATIC BIRD COMMUNITY COMPOSITION

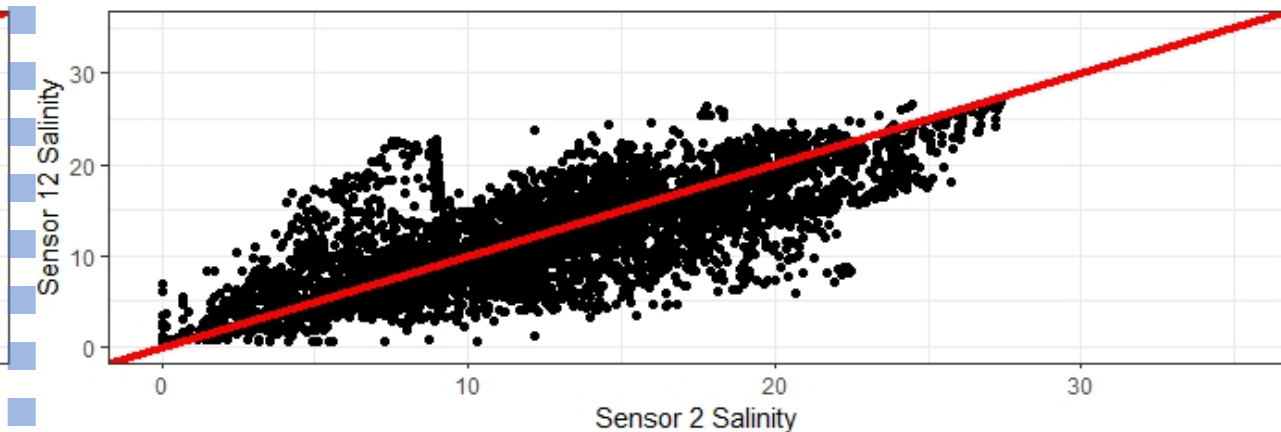

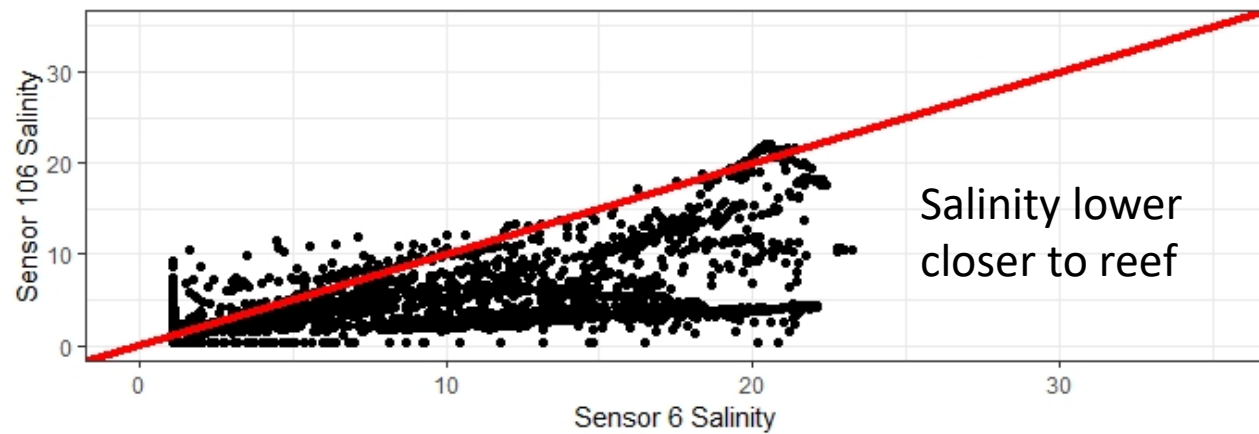

Land

- Unclear whether construction of reef has changed salinity patterns at river discharge levels observed since summer 2017

Higher salinity

Higher salinity

Land

Is Lone Cabbage a “success”?

- To be successful elsewhere AM programs will require **stronger, more decisive leadership** and **commitment to the process** to tackle these complex issues

Deviations in Discharge from Period of Record
